

PC POWER SUPPLY SUPERVISOR

 Check for Samples: [TPS3513](#)

FEATURES

- Overvoltage Protection and Lockout for 12 V, 5 V, and 3.3 V
- Overcurrent Protection and Lockout for 12 V, 5 V, and 3.3 V
- Undervoltage Protection and Lockout for 12 V, and Undervoltage Detect for 5 V and 3.3 V
- Fault-Protection Output With Open Drain Output Stage
- Open-Drain, Power Good Output Signal for Power-Good Input, 3.3 V and 5 V
- 300-ms Power-Good Delay
- 75-ms Delay for 5-V and 3.3-V Power Supply Short-Circuit Turnon Protection
- 2.3 ms $\overline{\text{PSON}}$ Control to $\overline{\text{FPO}}$ Turnoff Delay
- 38 ms $\overline{\text{PSON}}$ Control Debounce
- Wide Supply Voltage Range From 4.5 V to 15 V

**D OR N PACKAGE
(TOP VIEW)**

NC – No internal connection

DESCRIPTION

The TPS3513 is designed to optimize PC switching power supply system with minimum external components. It provides undervoltage lockout (UVLO), protection circuits, power good indicator, and on/off control.

TYPICAL APPLICATION

| | Max Output Current | Over Current Protection Trip Point† |
|-------|--------------------|-------------------------------------|
| 12 V | 6 A | 9.2 A |
| 5 V | 16 A | 24.6 A |
| 3.3 v | 9 A | 13.5 A |

† Over current protection trip point can be programmable.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

DESCRIPTION (CONTINUED)

UVLO thresholds are 4.45 V (on) and 3.65 V (off). Overcurrent protection (OCP) and overvoltage protection (OVP) monitor 3.3 V, 5 V, and 12 V. When an OC or OV condition is detected, the power-good output (PGO) is asserted low and the fault protection output (FPO) is latched high. PSON from low-to-high resets the latch. The OCP function will be enabled 75 ms after PSON goes low, and a debounce of typically 38 ms. A built-in 2.3-ms delay with 38-ms debounce from PSON to FPO output is enabled at turnoff.

An external resistor is connected between the RI pin and the GND pin. This will introduce an accurate $I_{(ref)}$ for OCP function. The $I_{(ref)}$ range is from 12.5 μ A to 62.5 μ A. The formula for choosing RI resistor is $V_{(RI)}/I_{(ref)}$. Three OCP comparators and the $I_{(ref)}$ section are supplied by VS12. The current draw from the VS12 pin is less than 1 mA.

The power good feature monitors PGI, 3.3 V and 5 V, and issues a power good signal when the output is ready.

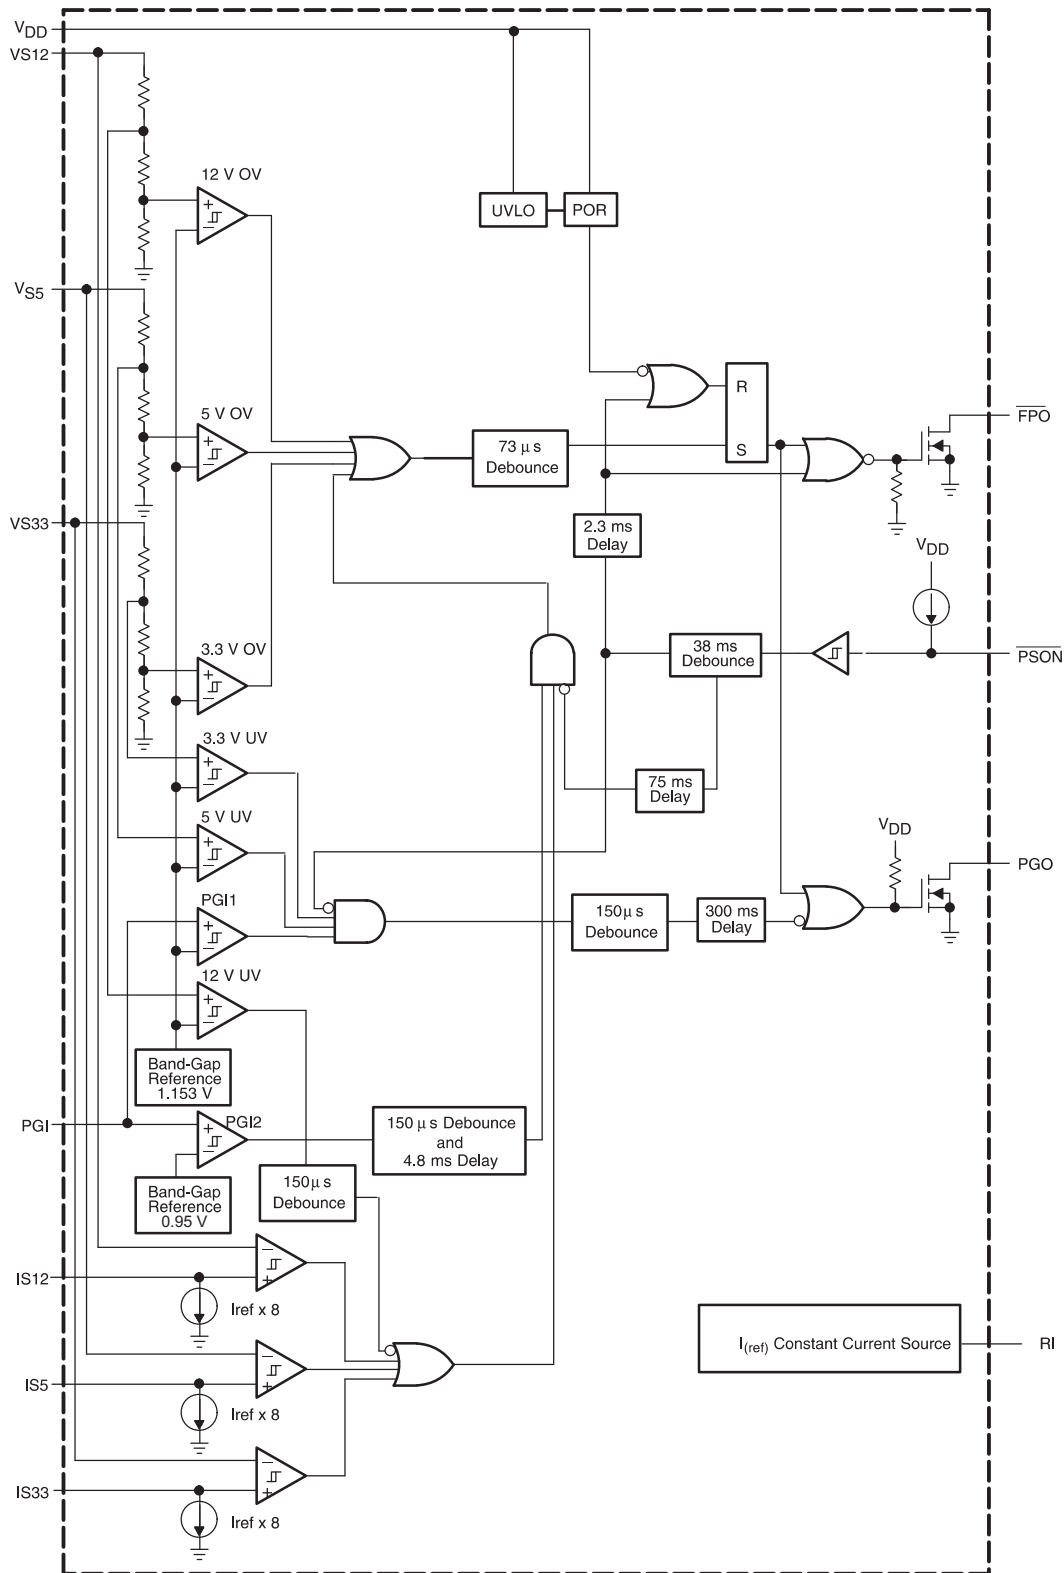

The TPS3513 is characterized for operation from -40° C to 85° C.

| VS5 | 12 | I | 5-V overvoltage protect/undervoltage detect |

DETAILED DESCRIPTION

Power-Good and Power-Good Delay

A PC power supply is commonly designed to provide a power-good signal, which is defined by the computer manufacturers. PGO is a power-good signal and should be asserted high by the PC power supply to indicate that the 5-VDC and 3.3-VDC outputs are above the undervoltage threshold limit. At this time the converter should be able to provide enough power to assure continuous operation within the specification. Conversely, when either the 5-VDC or the 3.3-VDC output voltages fall below the undervoltage threshold, or when main power has been removed for a sufficiently long time so that power supply operation is no longer assured, PGO should be deasserted to a low state.

The power-good (PGO), DC enable ($\overline{\text{PSON}}$), and the 5-V/3.3-V supply rails are shown in Figure 3.

Figure 3. Timing of $\overline{\text{PSON}}$ and PGO

Although there is no requirement to meet specific timing parameters, the following signal timings are recommended:

$$2 \text{ ms} \leq t_2 \leq 20 \text{ ms}, 100 \text{ ms} < t_3 < 2000 \text{ ms}, t_4 > 1 \text{ ms}, t_5 \leq 10 \text{ ms}$$

Furthermore, motherboards should be designed to comply with the above recommended timing. If timings other than these are implemented or required, this information should be clearly specified.

The TPS3513 family of power-supply supervisors provides a power-good output (PGO) for the 3.3-V and 5-V supply voltage rails and a separate power-good input (PGI). An internal timer is used to generate a 300-ms power-good delay.

If the voltage signals at PGI, VS33, and VS5 rise above the undervoltage threshold, the open-drain, power-good output (PGO) will go high after a delay of 300 ms. When the PGI voltage or any of the 3.3-V, 5-V rail drops below the undervoltage threshold, PGO will be disabled immediately.

Power-Supply Remote On/Off ($\overline{\text{PSON}}$) and Fault Protect Output ($\overline{\text{FPO}}$)

Since the latest personal computer generation focuses on easy turnon and power saving functions, the PC power supply will require two characteristics. One is a dc power supply remote on/off function; the other is standby voltage to achieve very low power consumption of the PC system. Thus, the main power needs to be shut down.

The power supply remote on/off ($\overline{\text{PSON}}$) is an active-low signal that turns on all of the main power rails including the 3.3-V, 5-V, -5-V, and -12-V power rails. When this signal is held high by the PC motherboard or left open circuited, the signal of the fault protect output ($\overline{\text{FPO}}$) also goes high. Thus, the main power rails should not deliver current and should be held at 0 V.

When the $\overline{\text{FPO}}$ signal is held high due to an occurring fault condition, the fault status will be latched and the outputs of the main power rails should not deliver current and should be held at 0 V. Toggling the power-supply remote on/off ($\overline{\text{PSON}}$) from low-to-high will reset the fault-protection latch. During this fault condition only the standby power is not affected.

When $\overline{\text{PSON}}$ goes from high to low or low-to-high, the 38-ms debounce block will be active to avoid that a glitch on the input will disable/enable the $\overline{\text{FPO}}$ output. During this period, the undervoltage function is disabled to prevent turnon failure.

Power should be delivered to the rails only if the $\overline{\text{PSON}}$ signal is held at ground potential, thus, $\overline{\text{FPO}}$ is active low. The FPO pin can be connected to 5 VDC (or up to 15 VDC) through a pullup resistor.

Under-Voltage Protection

The TPS3513 provides undervoltage protection (UVP) for the 12-V rail and undervoltage detect for the 3.3-V and 5-V rails. When an undervoltage condition appears at the VS12 input pin for more than 150 μs , the $\overline{\text{FPO}}$ output goes high and PGO goes low. Also, this fault condition will be latched until $\overline{\text{PSON}}$ is toggled from low-to-high or VDD is removed.

In flyback or forward type off-line switching power supplies, usually designed for small power, the overload protection design is very simple. Most of these type of power supplies are only sensing the input current for an overload condition. The trigger-point needs to be set much higher than the maximum load in order to prevent false turnon.

However, this will cause one critical issue. In case that the connected load is larger than the maximum allowable load but smaller than the trigger-point, the system will always become over-heated and cause failure and damage.

Overcurrent Protection

In bridge or forward type, off-line switching power supplies, usually designed for medium to large power, the overload protection design needs to be very precise. Most of these types of power supplies are sensing the output current for an overload condition. The trigger-point needs to be set higher than the maximum load in order to prevent false turnon.

The TPS3513 provides overcurrent protection (OCP) for the 3.3-V, 5-V, and 12-V rails. When an over current condition appears at the OCP comparator input pins for more than 73 μs , the $\overline{\text{FPO}}$ output goes high and PGO goes low. Also, this fault condition will be latched until $\overline{\text{PSON}}$ is toggled from low-to-high or VDD is removed.

The resistor connected between the RI pin and the GND pin will introduce an accurate $I_{(\text{ref})}$ for the OCP function. Of course, a more accurate resistor tolerance will be better. The formula for choosing the RI resistor is $V_{(\text{RI})}/I_{(\text{ref})}$. The $I_{(\text{ref})}$ range is from 12.5 μA to 62.5 mA. Three OCP comparators and the $I_{(\text{ref})}$ section are supplied by VS12. Current drawn from the VS12 pin is less than 1 mA.

Following is an example on calculating OCP for the 12-V rail:

$$RI = V_{(\text{RI})}/I_{(\text{ref})} = 1.15 \text{ V}/20 \mu\text{A} = 56 \text{ k}\Omega$$

$$I_{(ref)} \times C \times R_{(IS12)} = R_{(sense)} \times I_{(OCP_Trip)}$$

$$I_{(OCP_Trip)} = 20 \mu A \times 8 \times 560 \Omega / 0.01 \Omega = 9.2 A$$

C = Current ratio (see recommended operating conditions)

Overvoltage Protection

The overvoltage protection (OVP) of the TPS3513 monitors 3.3 V, 5 V, and 12 V. When an overvoltage condition appears at one of the 3.3-V, 5-V, or 12-V input pins for more than 73 μ s, the \overline{FPO} output goes high and PGO goes low. Also, this fault condition will be latched until \overline{PSON} is toggled from low-to-high or VDD is removed. During fault conditions, most power supplies have the potential to deliver higher output voltages than those normally specified or required. In unprotected equipment, it is possible for output voltages to be high enough to cause internal or external damage of the system. To protect the system under these abnormal conditions, it is common practice to provide overvoltage protection within the power supply.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

| | | | UNIT |
|------------------------------------|--------------------------------------|------------------------------------|---|
| V _{DD} | Supply voltage ⁽²⁾ | | 16 V |
| V _I | Input voltage ⁽²⁾ | \overline{PSON} , IS5, IS33, PGI | 8 V |
| | Input voltage | VS33, VS5 | 16 V |
| V _O | Output voltage | \overline{FPO} | V _{DD} + 0.3 V or 16 V (whichever is less) |
| | | PGO | V _{DD} + 0.3 V or 8 V (whichever is less) |
| All other pins ⁽²⁾ | | | –0.3 V to 16 V |
| Continuous total power dissipation | | | See Dissipation Rating Table |
| T _A | Operating free-air temperature range | | –40°C to 85°C |
| T _{stg} | Storage temperature range | | –65°C to 150°C |
| Soldering temperature | | | 260°C |

- (1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to GND.

DISSIPATION RATING TABLE

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
